

Merged Renko: ONE brick feeds a LONG book AND a SHORT book

A merged strategy watches **both directions at once**. Each brick makes **two** bits from the same colour: the **LONG bit** = **green=1/red=0**, and the **SHORT bit** = the **opposite** (green=0, red=1). So one brick can be a signal for the long book, the short book, or neither.

F1 is tested on **both** strings: a LONG spot when the LONG string ends in F1, a SHORT spot when the SHORT string ends in F1. The next brick gives that spot's result — long win = next green, short win = next red — and **both books share ONE outcome string**. **F2** arms off that one shared string. When armed, a spot **FIRES** — LONG is checked first, then SHORT if still free.

Worked example — F1 = 10 F2 = 01 or 10

brick #	1	2	3	4	5	6	7	8	9	10	11	12	full string
colour	G	R	G	R	R	G	G	R	R	G	R	G	
LONG bit	1	0	1	0	0	1	1	0	0	1	0	1	101001100101
SHORT bit (opposite)	0	1	0	1	1	0	0	1	1	0	1	0	010110011010
F1 spot LONG		▼		▼				▼			▼		
F1 spot SHORT			▼			▼				▼		▼	
Fake result (shared)			L:1	S:1	L:0		S:0		L:0		S:1	L:1	1100011
action						FIRE SHORT					FIRE LONG		
money trade							0 S					1 L	01

LONG string = **101001100101**, SHORT string = **010110011010** (opposite). shared outcome string = **1100011** → money-trade string = **01**.

It arms once the shared outcome ends in **01** or **10**, then fires: b6 SHORT, b11 LONG. Notice the **same one armed state** lets EITHER book fire — here a **SHORT** and later a **LONG** — and only one trade runs at a time (long is tried first, short only if the book is free).

Note. This is the **theoretical** set-up. Both books' bits, spots, the shared outcome string, and the F2 arm come purely from brick colours — they run on their own and do not care whether you trade, win, lose, or hit a broker error. Whether a real trade opens, at what price, and whether it stays on also depends on the live data feed, margin rules, exchange/broker fill behaviour, regulations, and connection.
